Patent Number and Name

RU176098U1

Mobile planetary rover robot for performing transport and technological work

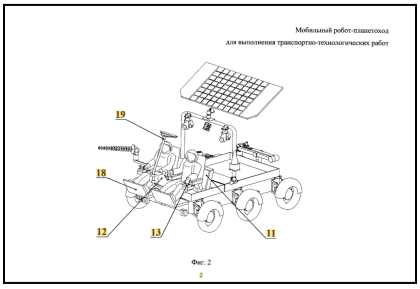

Patent Summary

It is a mobile planet-rover robot that can function autonomously and with human control. It is designed to move on the surface of the moon and carry out transport and technological operations. Additionally, there are seats for astronauts to sit in and control the vehicle; astronauts can use this device to explore the lunar surface and transport cargo from one location to another.

Patent Critique

It allows for the transport of goods and works autonomy while allowing for human intervention; however, human input is still required to transport the goods. The astronauts ride in the robot and help load the cargo whereas our robot must operate completely autonomously including picking up the cargo, placing it in the robot, and bringing it back to the habitat.
