Autonomous system for air cargo end-to-end operation

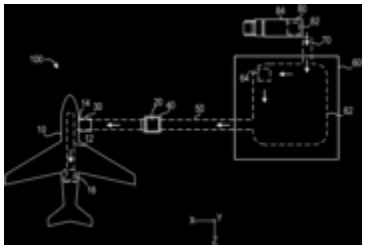

Patent Summary

This invention is an end-to-end cargo handling system. The systems include a transportation unit with a first sensing agent, a lift unit with a second sensing agent, and a control module in communication with the transportation unit and lift unit via network. The transportation unit and the lift unit were designed to move the cargo unit between two locations autonomously.

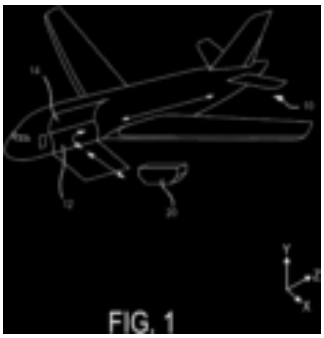

Patent Critique

This system to transport cargo autonomously from end to end operations work in the Earth's atmosphere. However our invention needs to be able to transport cargo on the lunar surface. I like the idea of flying the cargo from one location to another, but that could be an invention implemented in future years.
