DE102021001813B4

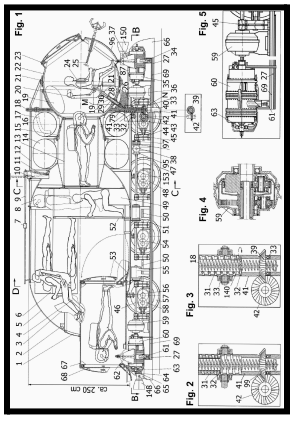

Patent Summary

This manned driving and flying lunar vehicle is designed for long-term stay and research within the module. It's capable of driving on the lunar terrain and flying over it, adapting based on the temperature fluctuations and equipped with materials needed for research. It's very beneficial for astronauts or lunar researchers searching for a quicker way to move back to the habitat/research lab after they collect samples.

Patent Critique

This relates to our HUNCH project because we need to design a cargo transport robot, meaning it needs to sufficiently have the capability to contain whatever size cargo we're planning to transport. This patent details that, although its priorities lie in being almost a makeshift habitat and lab on the move. Our robot will be unmanned as well, so the patent's descriptions of manned systems won't apply to us.
