https://mda.space/skymaker

Product Summary:

The MDA skymaker is a commercial suite of scalable and modular space robotics programs. It's main purpose is to provide commercial and government space programs with fast and affordable access to advanced human space robotics. It can robotically handle both small payloads and multi-ton cargo. It's integrated onto rovers to enable autonomous surface logistics.

Product Critique:

In terms of our HUNCH project, it covers the autonomous lunar cargo transport that our External Cargo Transport Robot is meant to take care of. However, the MDA skymaker is for the entire process of transporting astronauts to the moon, as well as developing various space robotics for the journey to the Moon and back. Our rover simply deals with transporting cargo to and from the habitat base.
