Name: Karunya Manivel **Scholarly Article**

Research Summary Sheet - Article #2

Complete the following form for each artifact that validates your problem statement.

Source (APA format and include a link to the source)

Lewis, R. (2018). *Human safety in the lunar environment*. Nss.Org.

https://nss.org/settlement/nasa/spaceresvol4/human.html

https://nss.org/settlement/nasa/spaceresvol4/human.html

Artifact Summary

It talks mainly about the hazards of walking on the moon. Some of these concerns include the atmosphere, water, chemicals in lunar soil, concentration of hydrogen, and the solar wind that contains many ionized atoms from the exterior of the sun. It also talks about byproducts that can be absorbed to get nutrients that humans need for survival through lunar community farming and filling stations, mostly going over how life on the lunar surface could be possible and tips for how to make that happen.

Artifact Critique

This article does shows both sides of how human survival on the moon is possible, but it talks more about how we can use the soil, sunlight, and chemicals on the moon to our benefit rather than the dangerous that can occur from incorrectly obtaining these materials (it only talks about the positive things that could happen rather than the downsides).

Reliability

This article is from the NSS website, but most of its references are from articles varying from Institution to Washington DC articles. I think this article is overall reliable as it combines both scholarly and regular articles to make scientific claims about life on the lunar surface, and is published by NSS.
